DETAILED ACTION

Specification

1. Applicant is reminded of the proper language and format for an abstract of the disclosure.

The abstract should be in narrative form and generally limited to a single paragraph on a separate sheet within the range of 50 to 150 words. It is important that the abstract not exceed 150 words in length since the space provided for the abstract on the computer tape used by the printer is limited. The form and legal phraseology often used in patent claims, such as "means" and "said," should be avoided. The abstract should describe the disclosure sufficiently to assist readers in deciding whether there is a need for consulting the full patent text for details.

2. The abstract of the disclosure is objected to because in line 6, the word "means" should be omitted. Correction is required. See MPEP § 608.01(b).

Claim Rejections - 35 USC § 102

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Art Unit: 3644

4. Claims 1-20 are rejected under 35 U.S.C. 102(b) as being anticipated by William et al. (5322034). William et al. disclose a method and apparatus for animal electronic data collecting comprising: a radio transmitter; a radio receiver; memory for storing information including a unique first identifier associated with said device; and a processor operatively connected to said radio transmitter to cause the transmission of radio signals therefrom, said processor also being operatively connected to said radio receiver to obtain radio signals from any other device which are received by said radio receiver, said radio signals received from each said other device representing a unique second identifier from each said other device, said processor being operatively connected to said memory to store in said memory each unique second identifier received from said at least one other device; wherein said processor will, upon the occurrence of a wakeup signal (20), cause said radio transmitter to transmit radio signals from said device representing said unique first identifier from said device (col. 2-col. 6).
